ABSTRACT

A form support for supporting a disposable mold form. The disposable mold form is adapted to be mounted on a bond beam for forming a cement coping. The form support includes a tie wire and an elongate tube. The tie wire has a head, an elongate midsection, and an end portion. The elongate midsection and the end portion are separated by a weakened portion. The tie wire is adapted to be positioned through the disposable form mold such that the head abuts the disposable mold form, the elongate midsection extends through the disposable mold form, and the end portion extends over the bond beam. The elongate tube is shaped to fit around the tie wire such that the elongate tube extends from the head to the vicinity of the weakened portion.
